1. Sample coding question

ALL

Test purpose

The purpose of this question is to get familiar with the test platform. The task consists in 3 steps:

1

1. Load the data available on the Website

2. Display variable content for debug

2

3. Submit your answer

All these steps will be performed via the `get_nb_rows` function.

1. Load the data available on the Website

The first step is to load the "data.csv" file.

The file is already accessible from the "local" file name space, so all you need to do is read the file using its relative file location, for example:

In Python:

```
import pandas as pd
df = pd.read_csv('dataSampleTest.csv')
```

In R:

```
df <- read.csv('dataSampleTest.csv')
```

2. Display variable content for debug

To see the result of your "print", you should :

1. Click on the checkbox "Test against custom input"
2. Fill in the text box that appears with : 'test' and return to a new line.
3. Click on the button "Run Code"
